

Amendments to the Claims:

This listing of the claims will replace all prior versions, and listings, of claims in the application.

1. (Currently amended) A method for transducing a gene into non-immortalized T cells, wherein said method comprises the step of contacting a paramyxovirus vector carrying the gene with activated non-immortalized T cells.

2. (Original) The method according to claim 1, wherein the paramyxovirus vector is a Sendai virus vector.

3-7. (Cancelled)

8. (New) The method according to claim 1, wherein the T cells are CD8⁺ T cells.

9. (New) The method according to claim 1, wherein the activated T cells are antigen-activated T cells.

10. (New) The method according to claim 9, wherein the antigen is an alloantigen.

11. (New) The method according to claim 9, comprising a step of stimulating T cells with an antigen.

12. (New) The method according to claim 11, wherein the antigen is an alloantigen.

13. (New) The method according to claim 9, further comprising a step of stimulating T cells with anti-CD3 antibody and anti-CD28 antibody.

14. (New) A non-immortalized T cell transduced with a foreign gene prepared by the method according to claim 1.

15. (New) The method according to claim 1, wherein the contact is done with co-existence of naive T cells and activated T cells, thereby transducing a gene into activated T cells with higher efficiency than naive T cells.

16. (New) A cell mixture prepared by the method according to claim 15, comprising activated non-immortalized T cells transduced with a foreign gene and naive T cells.

17. (New) A method of enhancing paramyxovirus vector-mediated gene transduction efficiency in non-immortalized T cells, wherein the method comprises the step of activating non-immortalized T cells before contacting the paramyxovirus vector.

18. (New) The method according to claim 17, wherein the T cells are CD8⁺ T cells.

19. (New) The method according to claim 17, wherein the T cells are antigen-activated.

20. (New) The method according to claim 19, wherein the antigen is an alloantigen.

21. (New) The method according to claim 19, further comprising a step of stimulating T cells with anti-CD3 antibody and anti-CD28 antibody.
